#### DETAILED ACTION

#### RCF

## Continued Examination Under 37 CFR 1.114

- 1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 1/13/2010 has been entered.
- 2. Claims 12-24 are allowed.

# Reason for Allowance

3. Re independent claim 12, the primary reason for the allowance of the claims is the inclusion of the feature that the electrical connection element includes a plate-shaped collar that covers the electrical connection element opening from outside of the motor housing, such that a vertical projection of the plate-shaped collar onto an outer surface of the motor housing completely encompasses the electrical connection element opening, while the electrical connection element is not in physical contact with the motor housing.

(See copied section below)

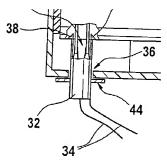

Application/Control Number: 10/572,173

Art Unit: 2834

wherein the electrical connection element includes a plate-shaped collar that covers the electrical connection element opening from outside of the motor housing, such that a vertical projection of the plate-shaped collar onto an outer surface of the motor housing completely encompasses the electrical connection element opening; and

wherein the electrical connection element is not in physical contact with the motor housing.

The claimed invention is as shown by Fig. 1 and described in para. [0012] as copied below.

Application/Control Number: 10/572,173 Page 4

Art Unit: 2834

The electrical connector plug is inserted through an opening 36 in motor housing 14 and attached directly to the electric motor via latching elements 38. In particular, plug 32 is attached to the electric motor without the use of fastening means mounted on motor housing 14. Attaching plug 32 directly to motor 12 in this manner prevents the possibility of a vibration bridge to motor housing 14 forming, thus preventing operating vibrations of the motor from being transmitted via the plug to motor housing 14 and thus, for example, to the air conditioning system. To avoid a vibration bridge of this type, a correspondingly large opening 36 through which plug 32 is insertable without establishing a vibration contact between plug element 32 and motor housing 14 is provided in motor housing 14 according to the exemplary embodiment shown in FIG. 1.

# 4. The closest cited prior art follow:

- a. Loup (US 4690366) is found to be the perfect reference for the disclosed invention except the electrical connection element is not in physical contact with the motor housing.
- b. Wintermute (US 5006748) and Miller et al (US 4864176) teach a plate-shaped collar that covers the electrical connection element opening from outside of the motor housing, such that a vertical projection of the plate-shaped collar onto an outer surface of the motor housing completely encompasses the electrical connection element opening, except the electrical connection element is not in physical contact with the motor housing since the connect 48 is mounted on the portion of housing.

Application/Control Number: 10/572,173
Art Unit: 2834

c. Bacile et al (US 2003/0080635, 6717299) shows and discloses [0019] the connector is not in directly contact with the housing. However, Bacile failed to teach the plate-shaped collar that covers the electrical connection element opening from outside of the motor housing.

The examiner found no prior art, alone or in combination, that satisfies all above conditions. The examiner regards the claimed invention is unique since, in view of those ordinary skilled in the art, the connection element not being physically contacted to housing would cause a noise due to bumping with the housing because of vibrations in the vehicle and fan rotation. In order to avoid the bumping noise, the clearance around the connection element should be large enough. However, in this case, the motor would be polluted by foreign particles flown into the space. Thus, the ordinary skilled in the art would seal the clearance. Therefore, the claimed invention is unique.
